

# Developing Applications with Google Cloud

---

<b>Code:</b>	GCP-DEV
<b>Length:</b>	3 days
<b>URL:</b>	<a href="#">View Online</a>

---

In this course, application developers learn how to design, develop, and deploy applications that seamlessly integrate components from the Google Cloud ecosystem. Through a combination of presentations, demos, and hands-on labs, participants learn how to use GCP services and pre-trained machine learning APIs to build secure, scalable, and intelligent cloud-native applications.

## Skills Gained

This course teaches participants the following skills:

- Use best practices for application development.
- Choose the appropriate data storage option for application data.
- Implement federated identity management.
- Develop loosely coupled application components or microservices.
- Integrate application components and data sources.
- Debug, trace, and monitor applications.
- Perform repeatable deployments with containers and deployment services.
- Choose the appropriate application runtime environment; use Google Kubernetes Engine as a runtime environment and later switch to a no-ops solution with Google App Engine Flex.

## Who Can Benefit

Application developers who want to build cloud-native applications or redesign existing applications that will run on Google Cloud

## Prerequisites

To get the most benefit from this course, participants should have the following prerequisites:

- Completed Google Cloud Fundamentals or have equivalent experience
- Working knowledge of Node.js
- Basic proficiency with command-line tools and Linux operating system environments

# Course Details

The course includes presentations, demonstrations, and hands-on labs.

## Course Outline

### Module 1: Best Practices for Application Development

- Code and environment management
- Design and development of secure, scalable, reliable, loosely coupled application components and microservices
- Continuous integration and delivery
- Re-architecting applications for the cloud

### Module 2: Google Cloud Client Libraries, Google Cloud SDK, and Google Firebase SDK

- How to set up and use Google Cloud Client Libraries, Google Cloud SDK, and Google Firebase SDK
- Lab: Set up Google Client Libraries, Google Cloud SDK, and Firebase SDK on a Linux instance and set up application credentials

### Module 3: Overview of Data Storage Options

- Overview of options to store application data
- Use cases for Google Cloud Storage, Google Cloud Datastore, Cloud Bigtable, Google Cloud SQL, and Cloud Spanner

### Module 4: Best Practices for Using Google Cloud Datastore

- Best practices related to the following: Queries, Built-in and composite indexes, Inserting and deleting data (batch operations), Transactions, Error handling
- Bulk-loading data into Cloud Datastore by using Google Cloud Dataflow
- Lab: Store application data in Cloud Datastore

### Module 5: Performing Operations on Buckets and Objects

- Operations that can be performed on buckets and objects
- Consistency model
- Error handling

### Module 6: Best Practices for Using Google Cloud Storage

- Naming buckets for static websites and other uses
- Naming objects (from an access distribution perspective)
- Performance considerations
- Setting up and debugging a CORS configuration on a bucket
- Lab: Store files in Cloud Storage

### Module 7: Handling Authentication and Authorization

- Cloud Identity and Access Management (IAM) roles and service accounts
- User authentication by using Firebase Authentication
- User authentication and authorization by using Cloud Identity-Aware Proxy

- Lab: Authenticate users by using Firebase Authentication

## Module 8: Using Google Cloud Pub/Sub to Integrate Components of Your Application

- Topics, publishers, and subscribers
- Pull and push subscriptions
- Use cases for Cloud Pub/Sub
- Lab: Develop a backend service to process messages in a message queue

## Module 9: Adding Intelligence to Your Application

- Overview of pre-trained machine learning APIs such as Cloud Vision API and Cloud Natural Language Processing API

## Module 10: Using Google Cloud Functions for Event-Driven Processing

- Key concepts such as triggers, background functions, HTTP functions
- Use cases
- Developing and deploying functions
- Logging, error reporting, and monitoring

## Module 11: Managing APIs with Google Cloud Endpoints

- Open API deployment configuration
- Lab: Deploy an API for your application

## Module 12: Deploying an Application by Using Google Cloud Cloud Build, Google Cloud Container Registry, and Google Cloud Deployment Manager

- Creating and storing container images
- Repeatable deployments with deployment configuration and templates
- Lab: Use Deployment Manager to deploy a web application into Google App Engine flexible environment test and production environments

## Module 13: Execution Environments for Your Application

- Considerations for choosing an execution environment for your application or service: Google Compute Engine, Kubernetes Engine, App Engine flexible environment, Cloud Functions, Cloud Dataflow
- Lab: Deploying your application on App Engine flexible environment

## Module 14: Debugging, Monitoring, and Tuning Performance by Using Google Stackdriver

- Stackdriver Debugger
  - Stackdriver Error Reporting
  - Lab: Debugging an application error by using Stackdriver Debugger and Error Reporting
  - Stackdriver Logging
  - Key concepts related to Stackdriver Trace and Stackdriver Monitoring. Lab: Use Stackdriver Monitoring and Stackdriver Trace to trace a request across services, observe, and optimize performance
-
